

PHASE 0 · ENVIRONMENT AND DATA

Hypotheses decided in 15: PH1 fusion beats thermal alone (04 vs 07) · PH2 gating adds value (07 vs 08, probe in 09) · PH3 small objects on M3FD (05 vs 07) · PH4 the scan is needed (07 vs gated-conv control in 08) · PH5 latency at most twice the baseline (09)

Solid arrows: data and checkpoints. Dashed: metrics read directly. Each training notebook is saved as a Kaggle version so its checkpoints can be attached to 09 and 15.
